

Butterfly patterns

Name

Date

Many of the world's largest butterflies can be found in rain forests. Some are brightly coloured. Others are camouflaged to look like leaves. This means it is hard for them to be seen by predators, such as birds.

Complete the butterfly drawings below. Each side is symmetrical, which means that the shape, size and colour of the wings are the same on each side of the body.

When you have finished your drawings, colour them in. Make two of them brightly coloured, and two of them camouflaged to look like leaves.
